J.vanAmerongen@utwente.nl

- Why PID-control
- When PID control
- Tuning rules (Ziegler-Nichols)
- Examples

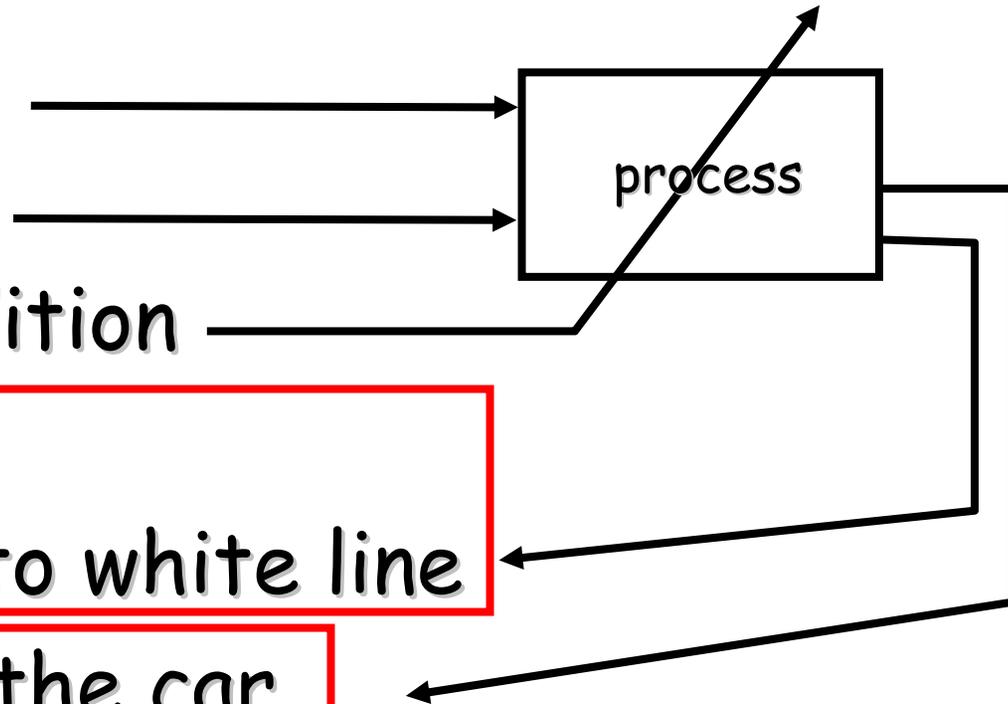

- Most widely applied type of controller
 - in industry probably 90% of all controllers
- Available as single controllers or implemented in computers
- Applicable to many processes
- Give a **reasonable** performance
- Fuzzy is often PID-like as well

- Stopping a car at a traffic light
- Cruise control system

- Stopping a car at a traffic light
- Goal
 - Stop in time at the white line

- Gas pedal
- Brakes
- Road condition

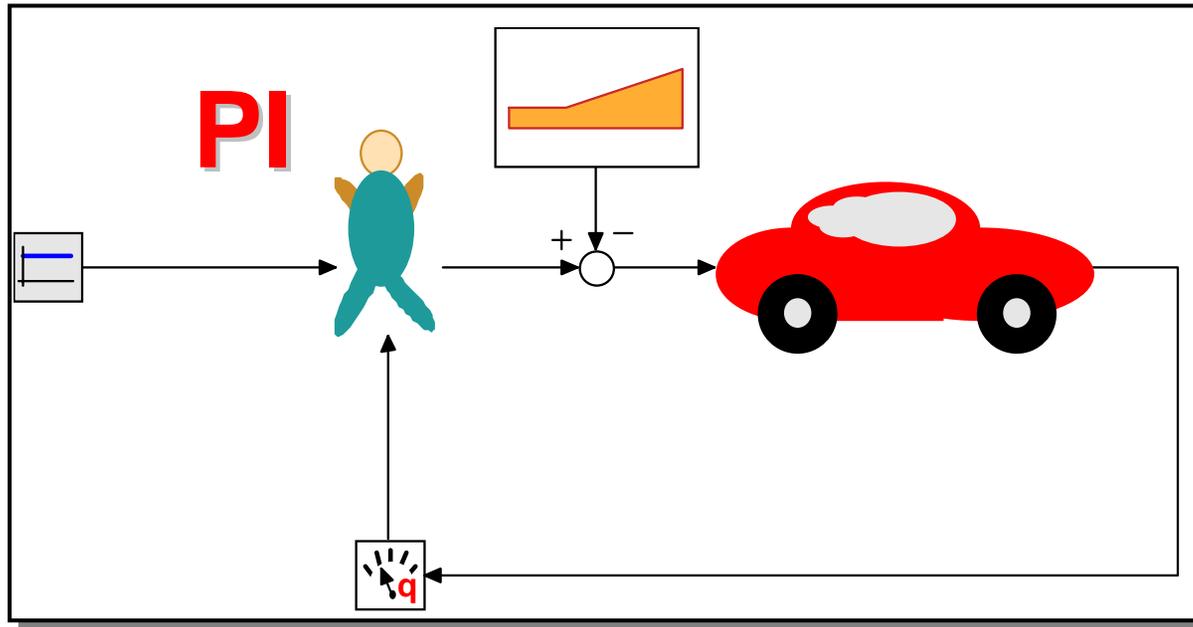

P

- Distance to white line

- Speed of the car

D

I-action necessary in order to deal with constant disturbance at input of process

- Limited accuracy for systems higher than first order
- Limited bandwidth

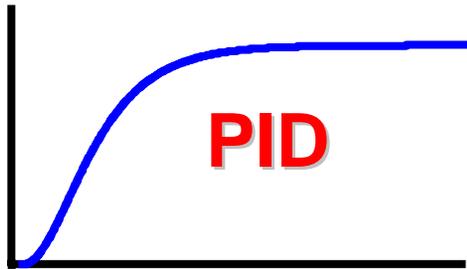

- For a second order system:
 - PD-control \approx state feedback
- Comparable with a lead network

PD-control is applicable as long as the system behaves more or less like a second-order system

- For increased accuracy of type-0 systems
 - add an integration
- Comparable with a lag network
- If dead time is dominant:
 - pure I-control

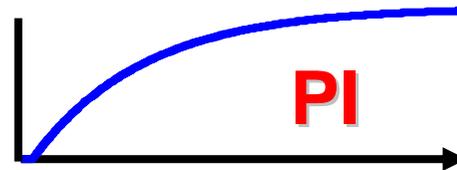

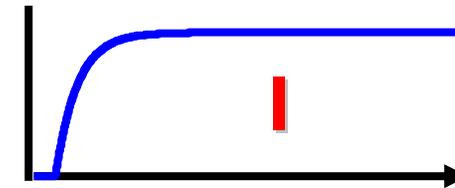

- For systems of type-0 and a **dominant** second-order behaviour
 - PID-control
- Can be seen as a combination of a lead and a lag network

$$H(s) = \frac{K}{(s\tau_1 + 1)(s\tau_2 + 1)(s\tau_3 + 1)(\dots)}$$

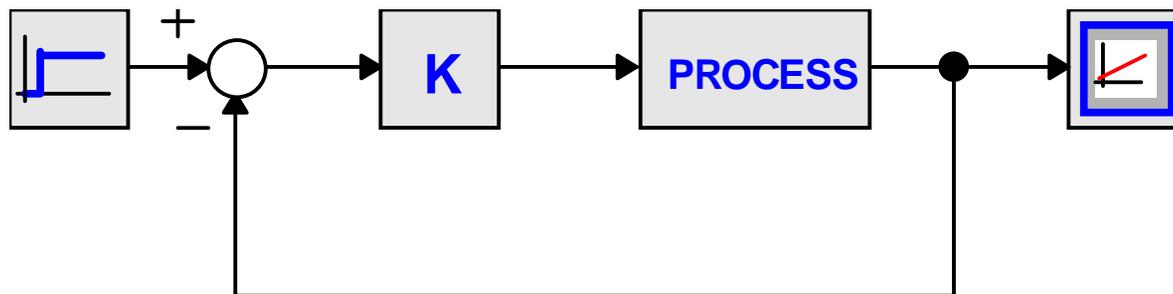

typical S-curve

$$H(s) = \frac{K e^{-sT_d}}{(s\tau_1 + 1)}$$

$$H_{\text{process}}(s) = \frac{K'}{(s+1)(s+2)(s+3)}$$

assumed to be unknown

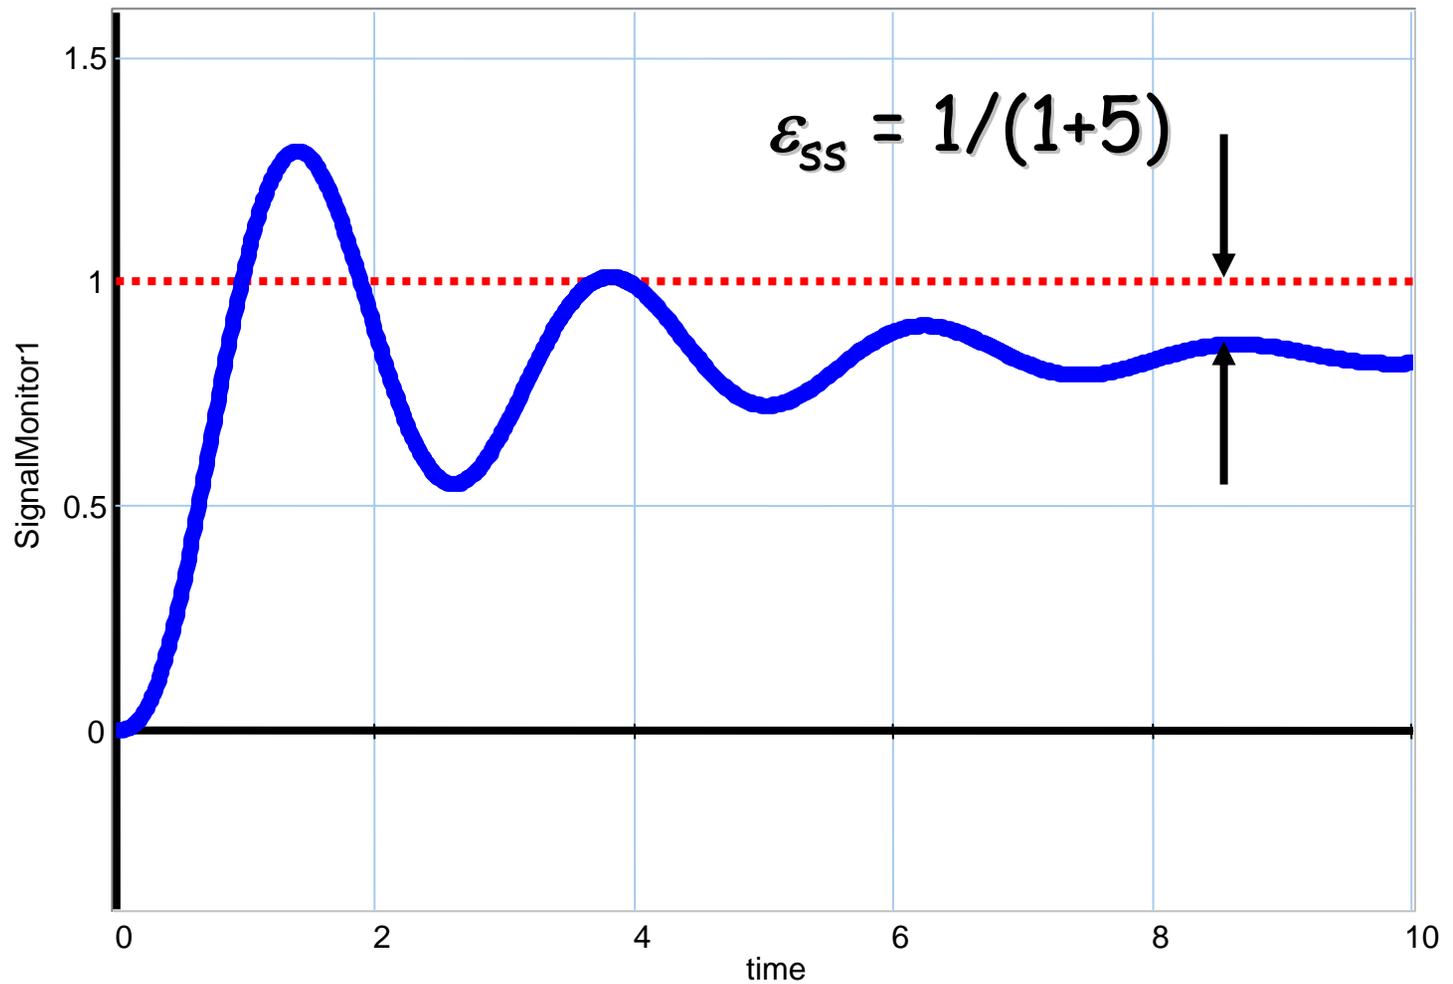

20-sim: PID_tuning_P

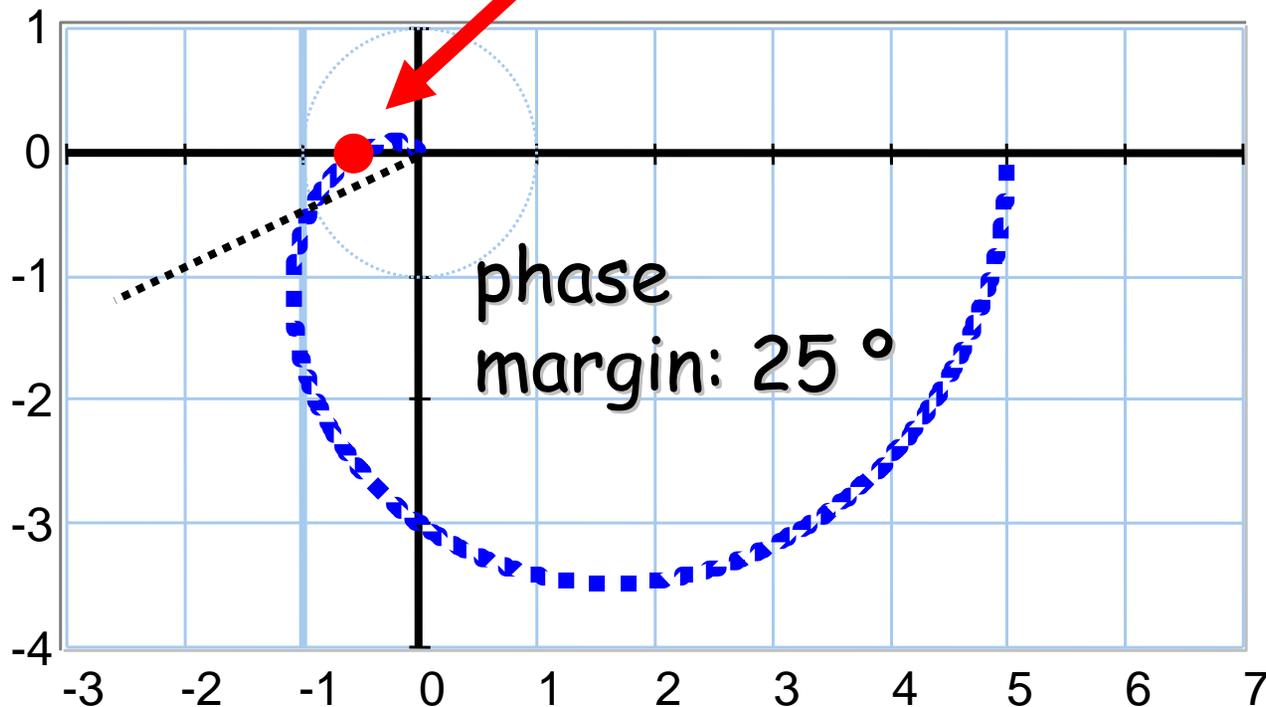

Bring feedback system
at the border of instability

- After a few experiments we find
 - controller gain $K_u = 10$ brings the system at the border of instability
- A gain margin of 6 dB (a factor two) is a reasonable choice for the gain of a proportional controller

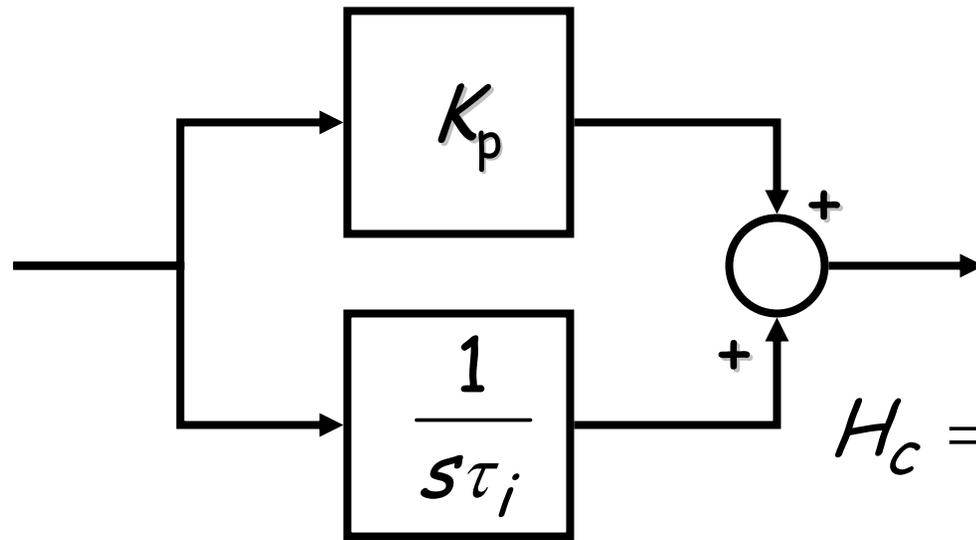

Response (GM = 6 dB)

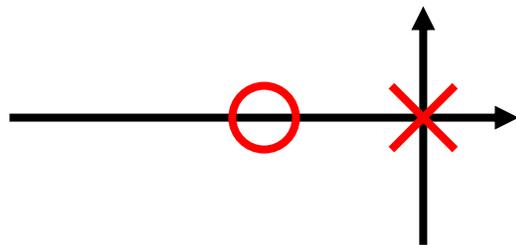

Identification of one
single point of Nyquist plot

PI-controller (parallel)

$$H_c = K_p + \frac{1}{s\tau_i} = \frac{1}{\tau_i} \frac{K_p s \tau_i + 1}{s}$$

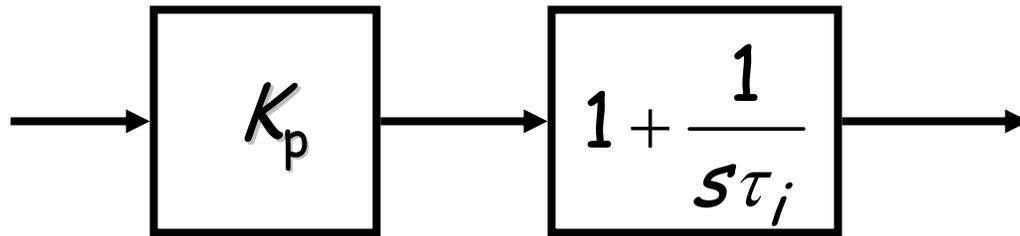

lag network
with pole in origin

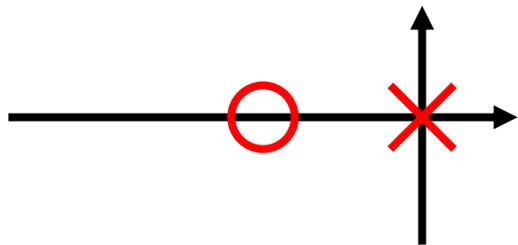

$$\text{zero in: } s = -\frac{1}{K_p \tau_i}$$

$$\text{system gain: } \frac{1}{\tau_i}$$

PI-controller (series)

$$H_c = K_p \left(1 + \frac{1}{s\tau_i} \right) = \frac{K_p}{\tau_i} \frac{s\tau_i + 1}{s}$$

lag network
with pole in origin

$$\text{zero in: } s = -\frac{1}{\tau_i}$$

$$\text{system gain: } \frac{K_p}{\tau_i}$$

P-control

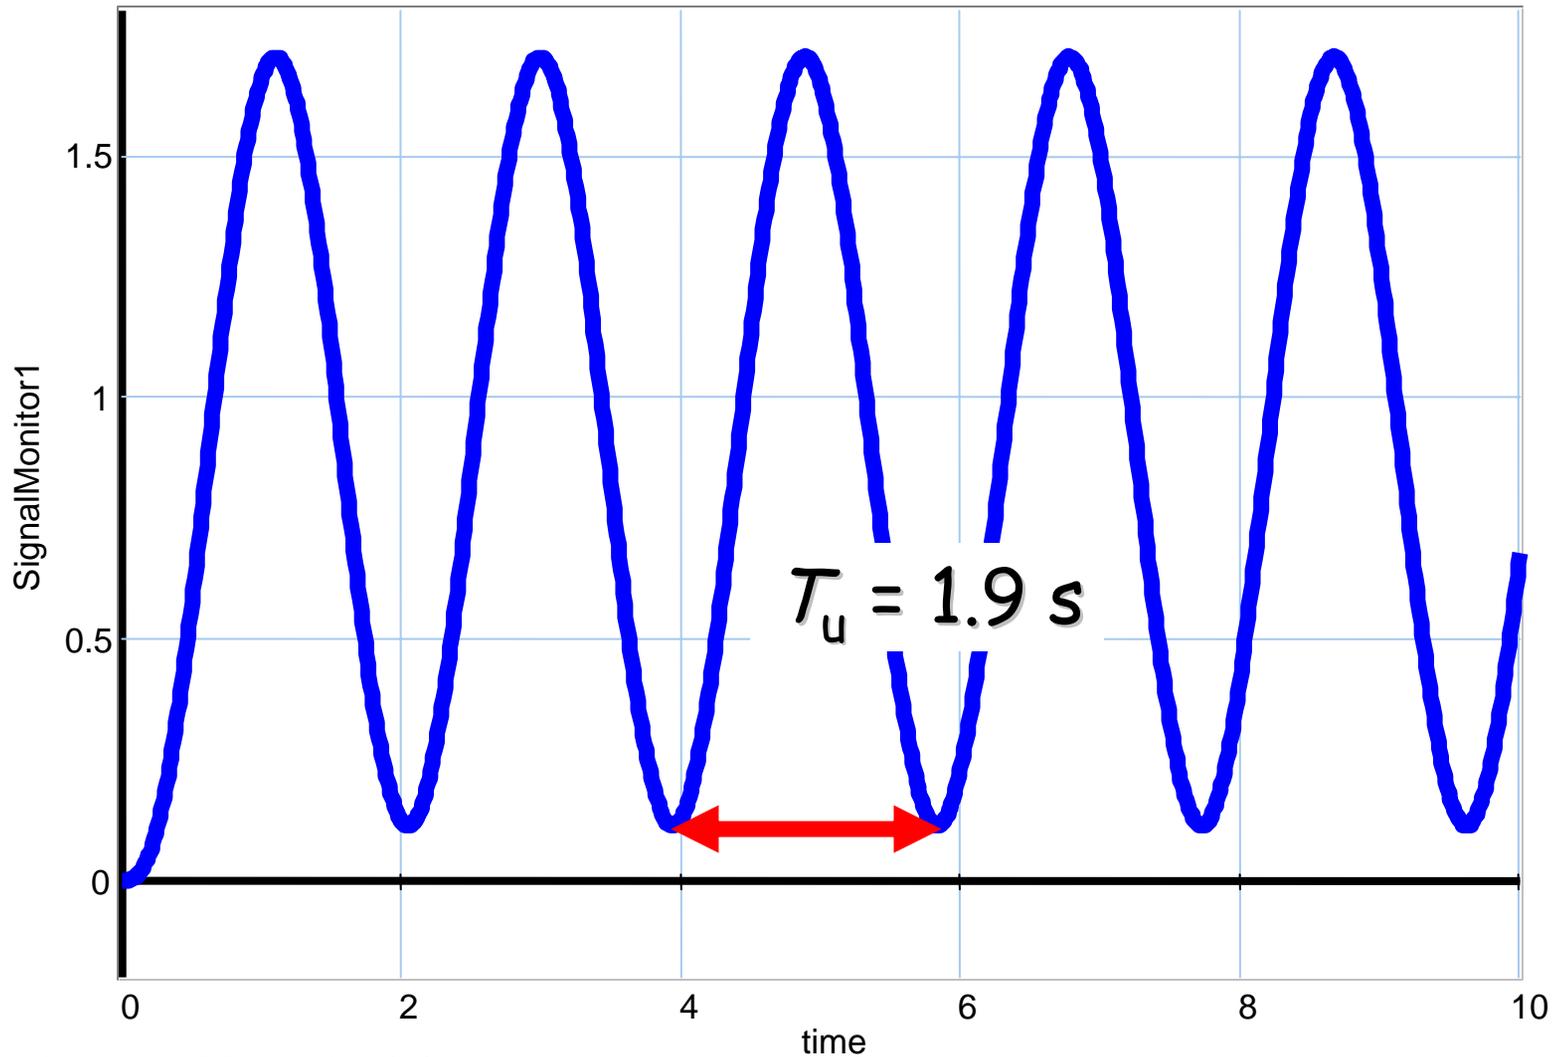

$$K_p = 0.5K_u$$

PI-control
series form

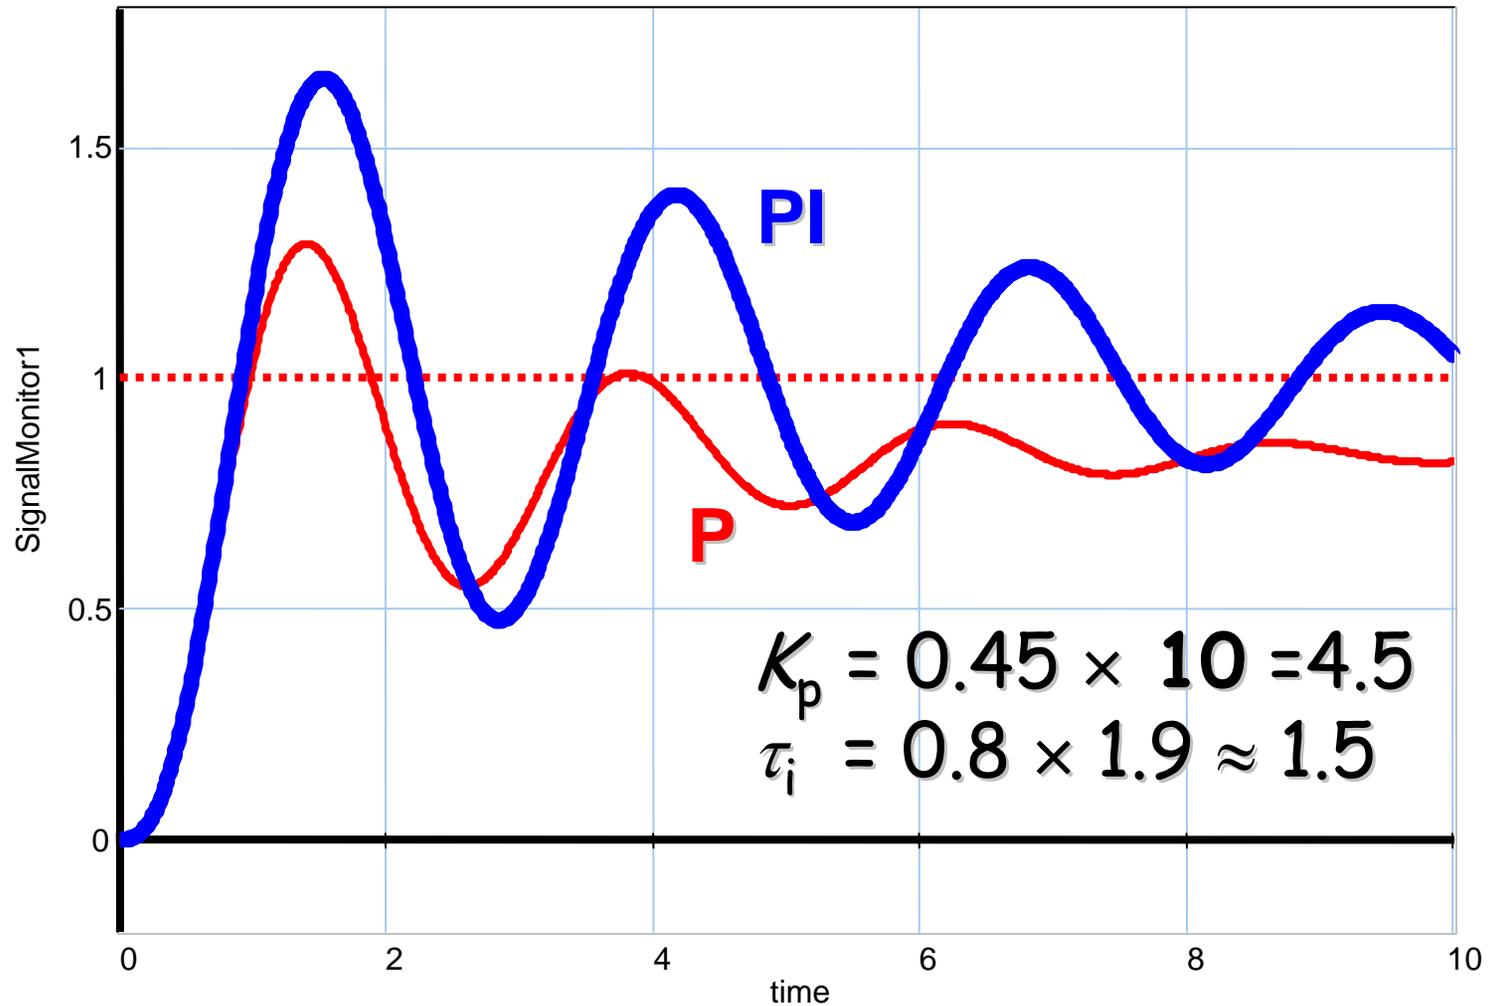

$$K_p = 0.45 K_u$$

$$\tau_i = 0.8 T_u$$

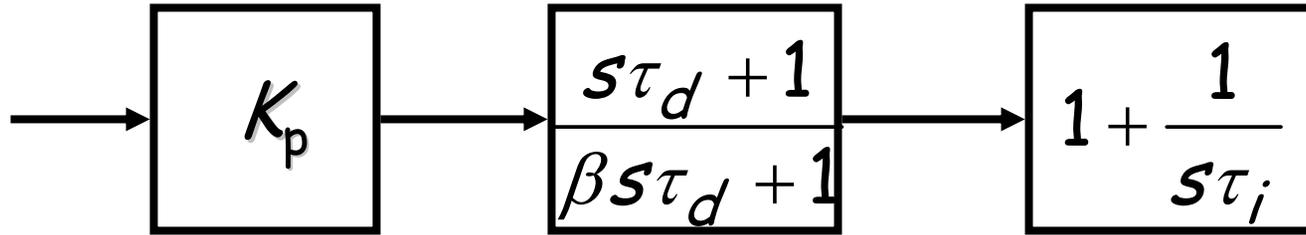

Oscillation period

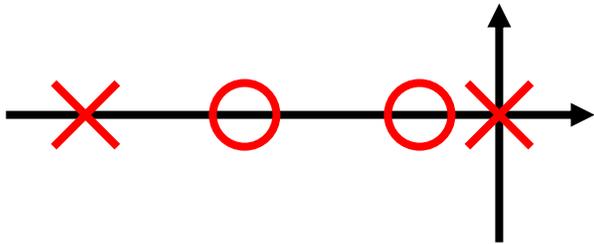

PI-response

PID-controller (series)

$$H_c = K_p \left(1 + \frac{1}{s\tau_i} \right) \left(\frac{s\tau_d + 1}{\beta s\tau_d + 1} \right) = \frac{K_p}{\tau_i} \left(\frac{s\tau_i + 1}{s} \right) \left(\frac{s\tau_d + 1}{\beta s\tau_d + 1} \right)$$

$\beta = \text{typically } 0.1$

lead/lag network
with pole in origin

P-control

$$K_p = 0.5K_u$$

PI-control
series form

$$K_p = 0.45 K_u$$

$$\tau_i = 0.8 T_u$$

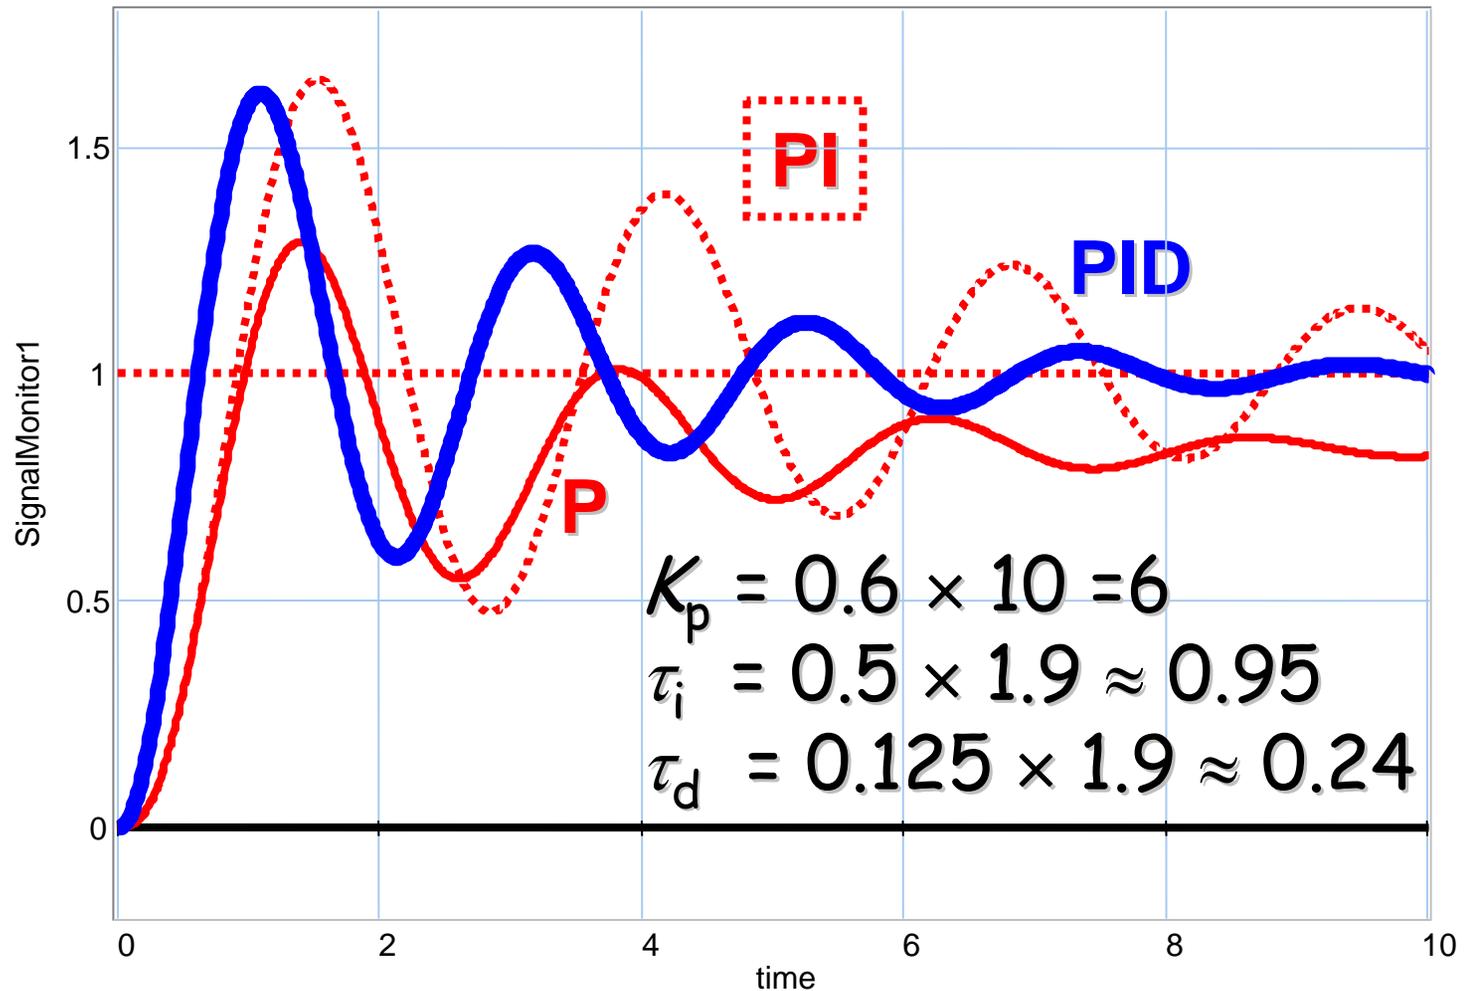

PID-control
series form

$$K_p = 0.6 K_u$$

$$\tau_i = 0.5 T_u$$

$$\tau_d = 0.125 T_u$$

PID-response

Disturbance rejection

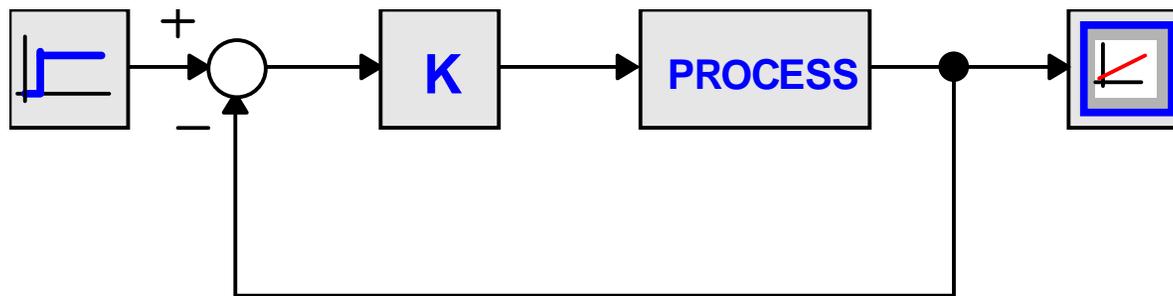

Tuning (τ and T_d)

$$H_{\text{process}}(s) = \frac{K e^{-0.1s}}{(s + 1)}$$

small dead time
large time constant

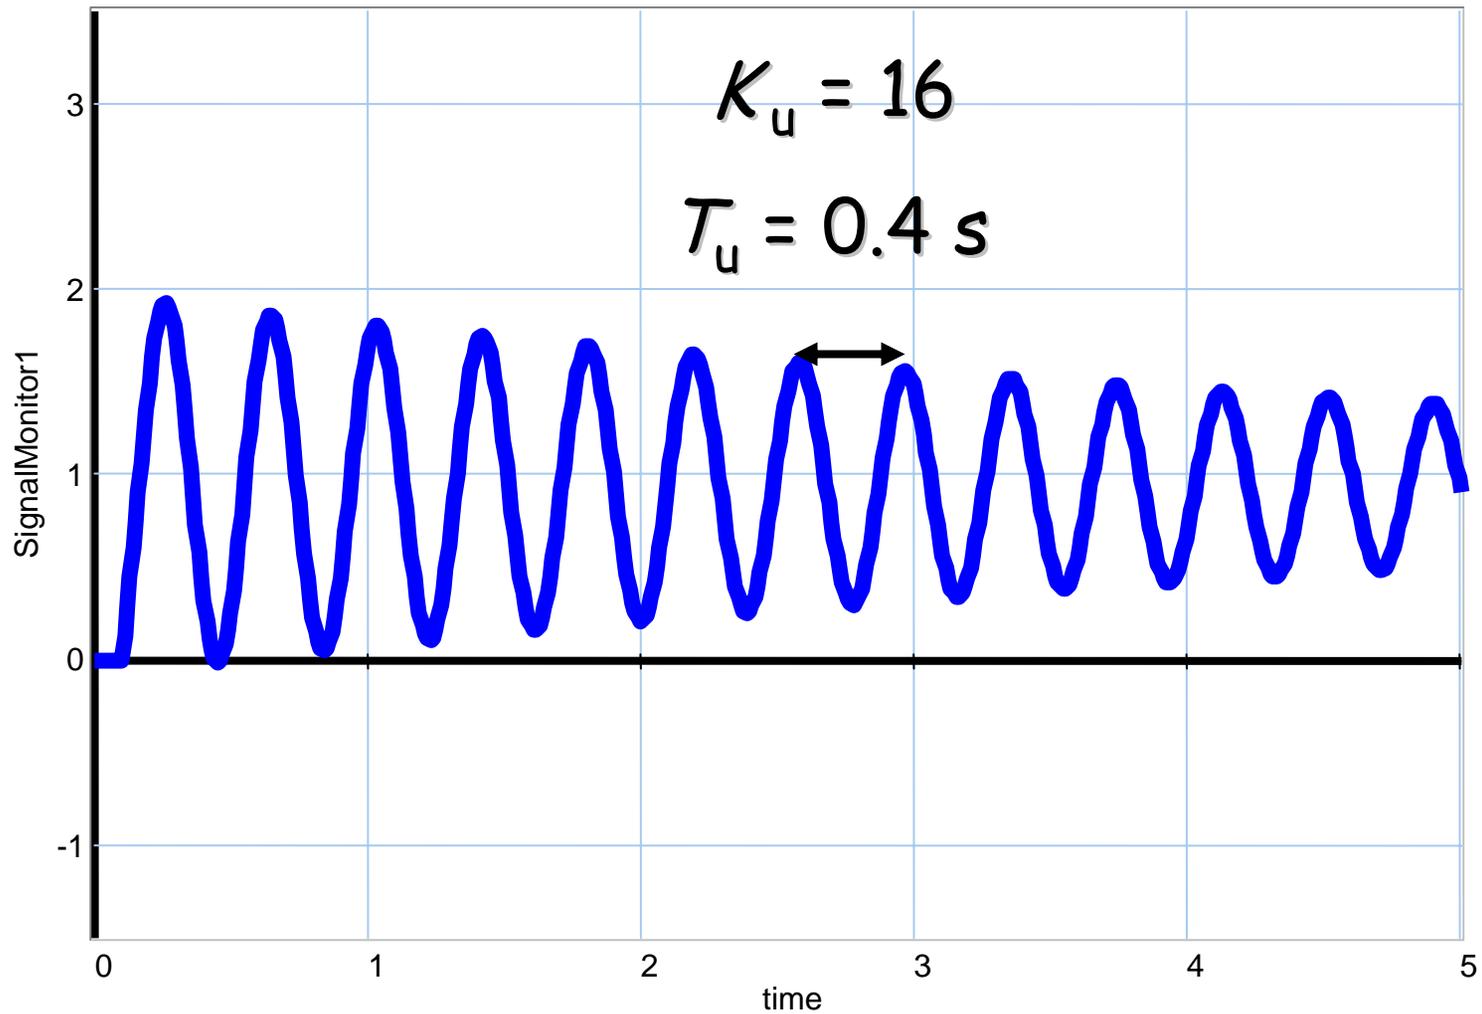

assumed to be unknown

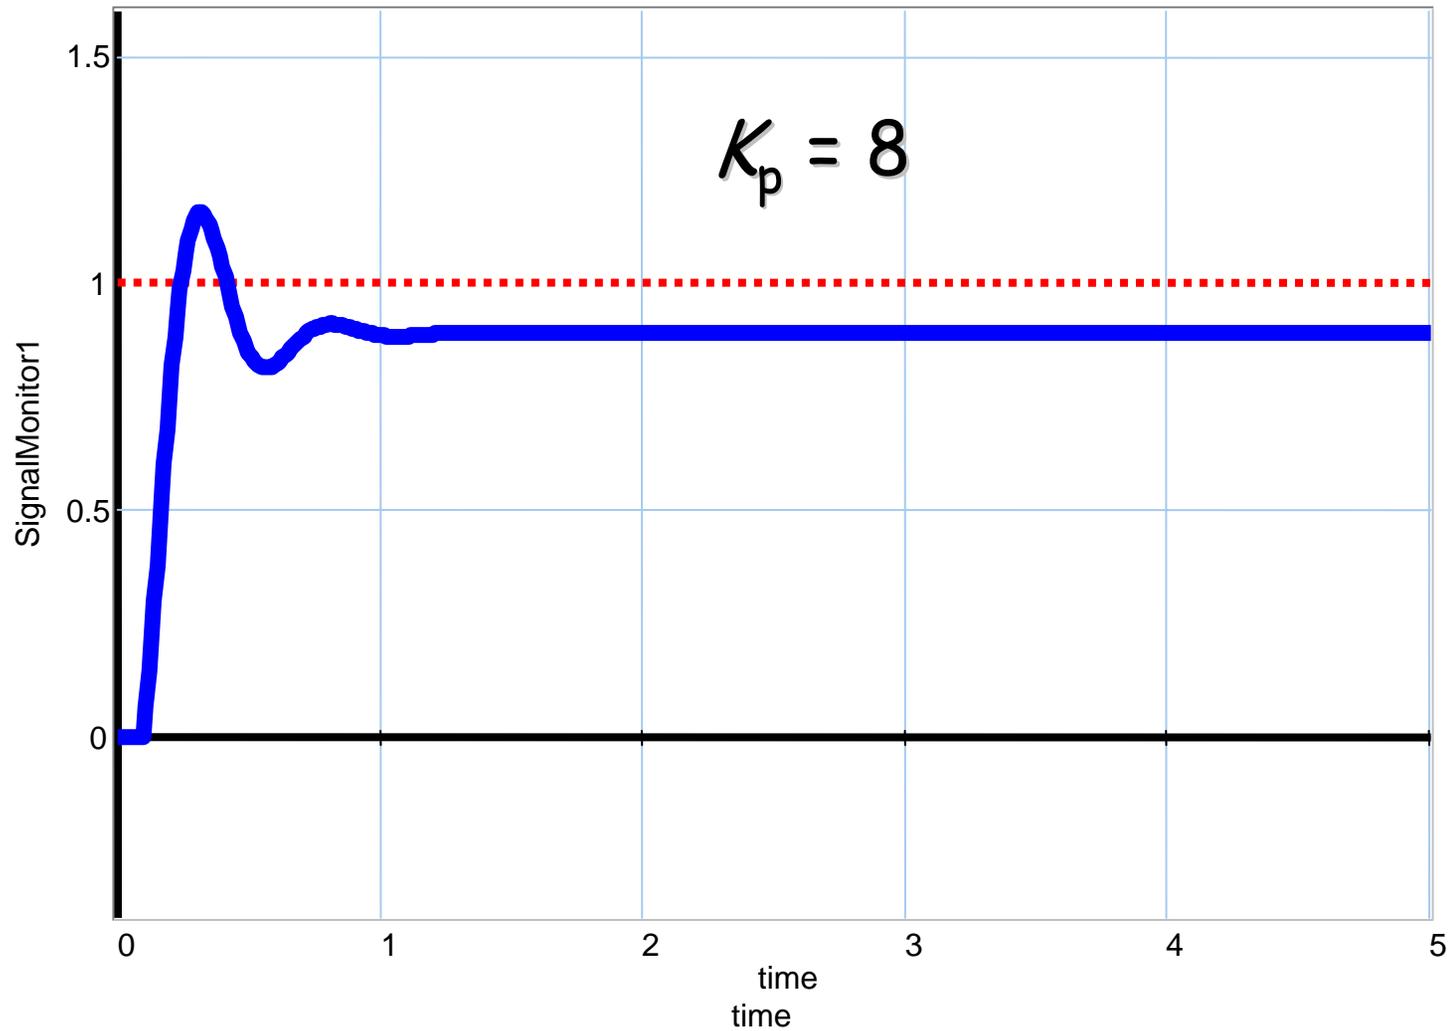

20-sim: PID_tuning_P_Td

Bring feedback system
at the border of instability

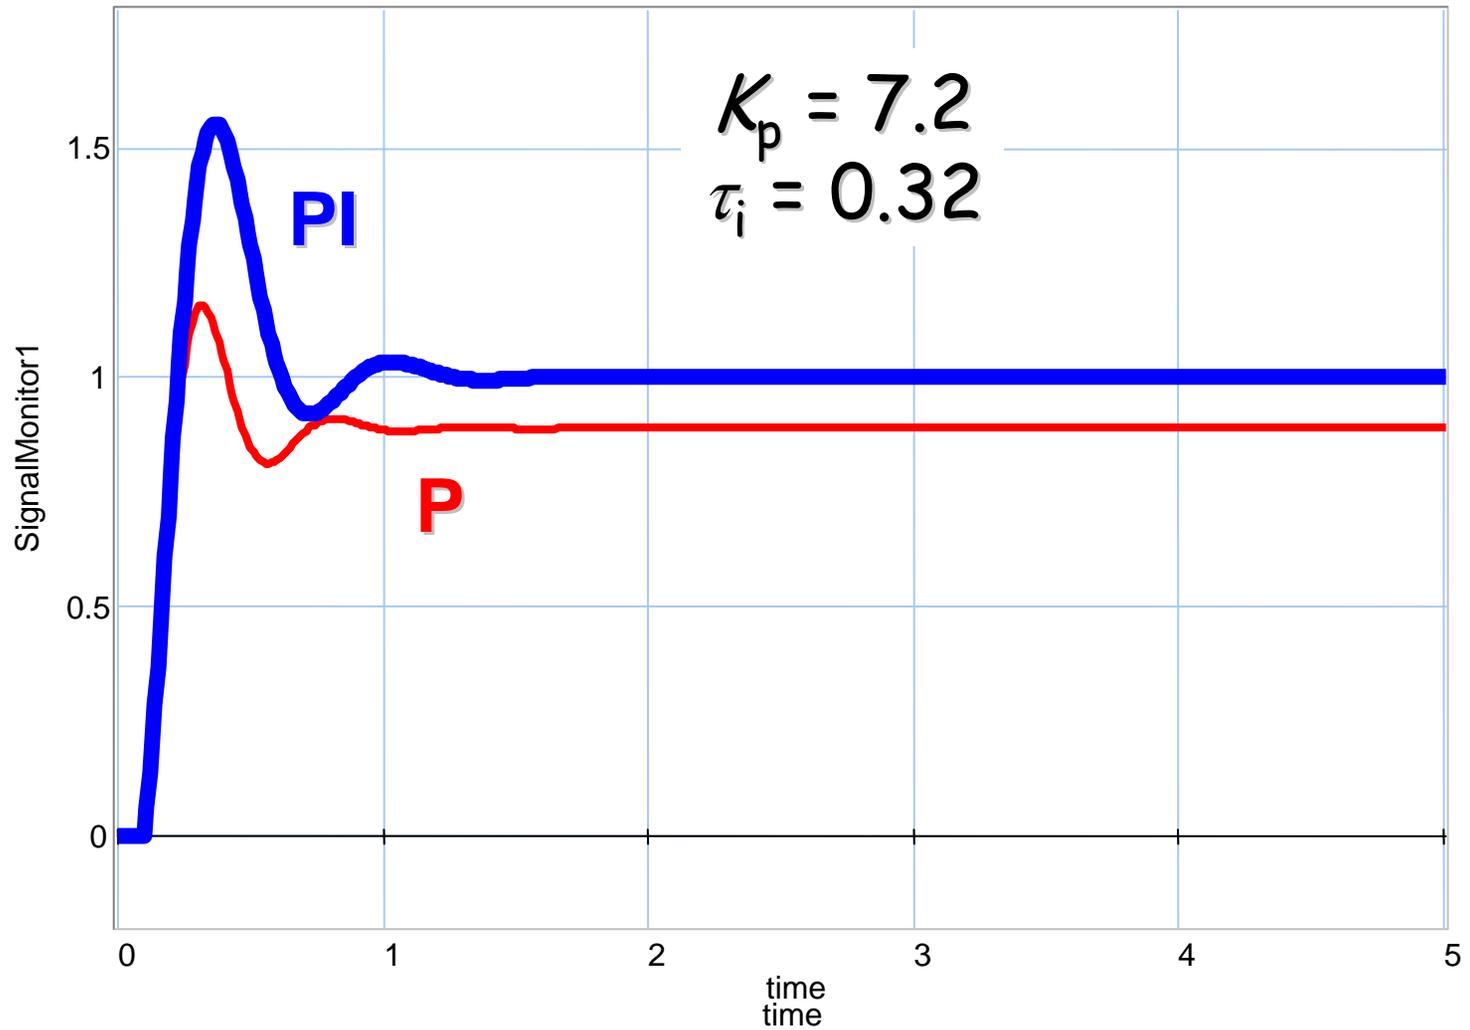

Border of instability

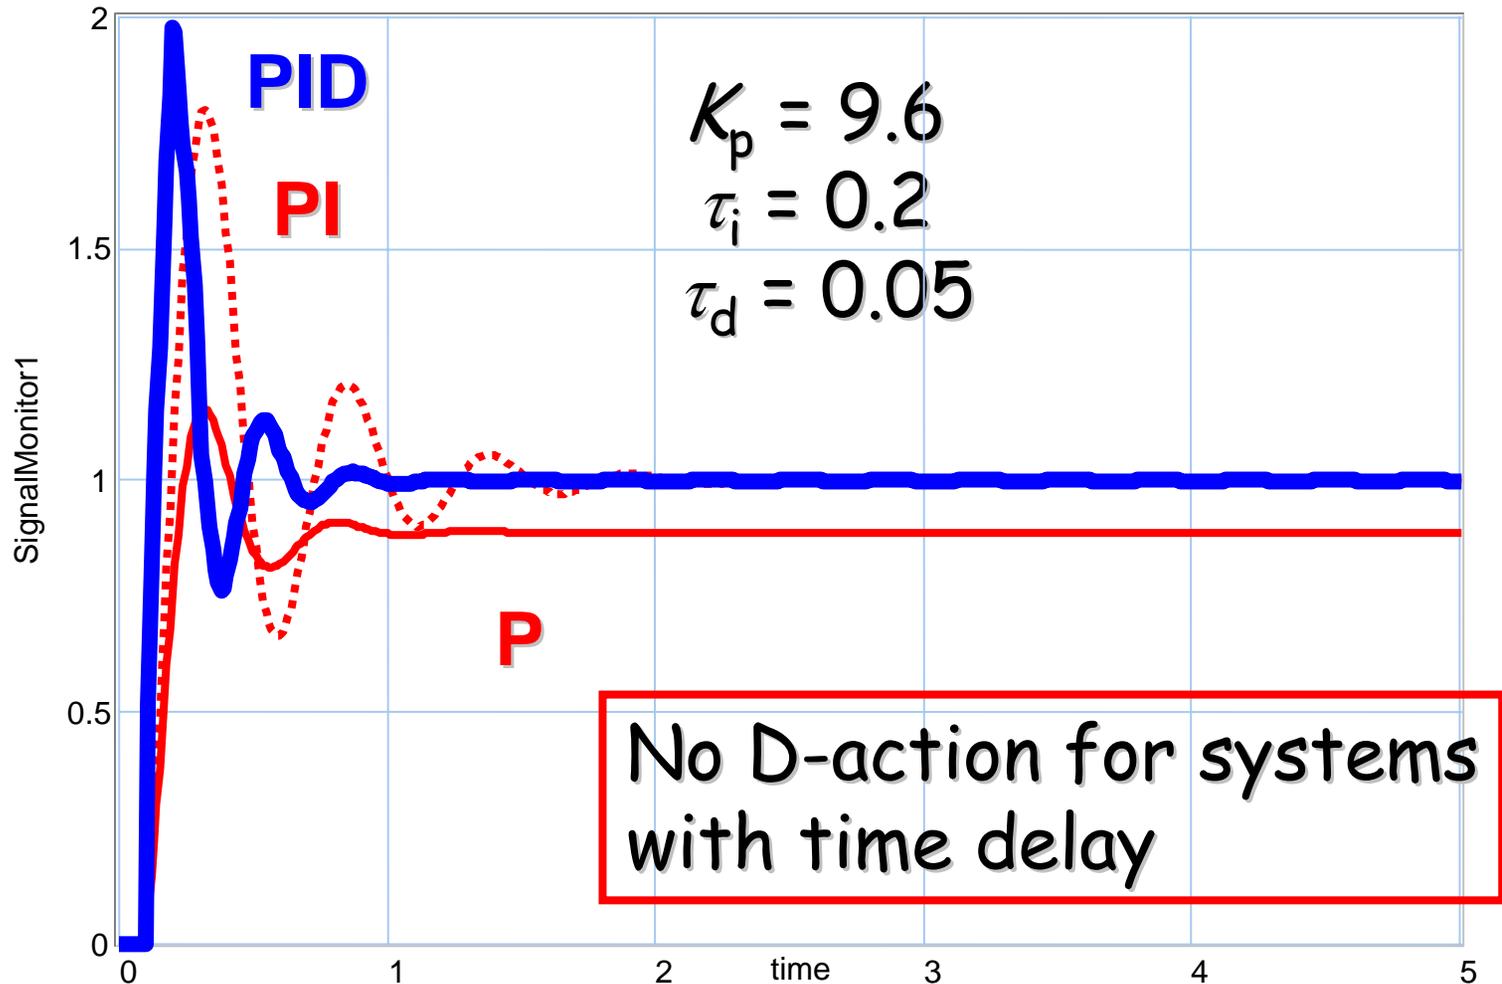

P-controller

PI-controller

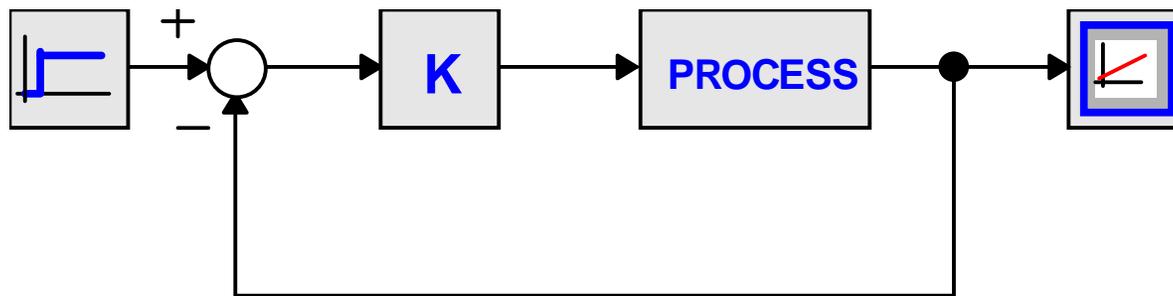

Tuning (τ and T_d)

$$H_{\text{process}}(s) = \frac{K e^{-1s}}{(s + 0.1)}$$

large dead time
small time constant

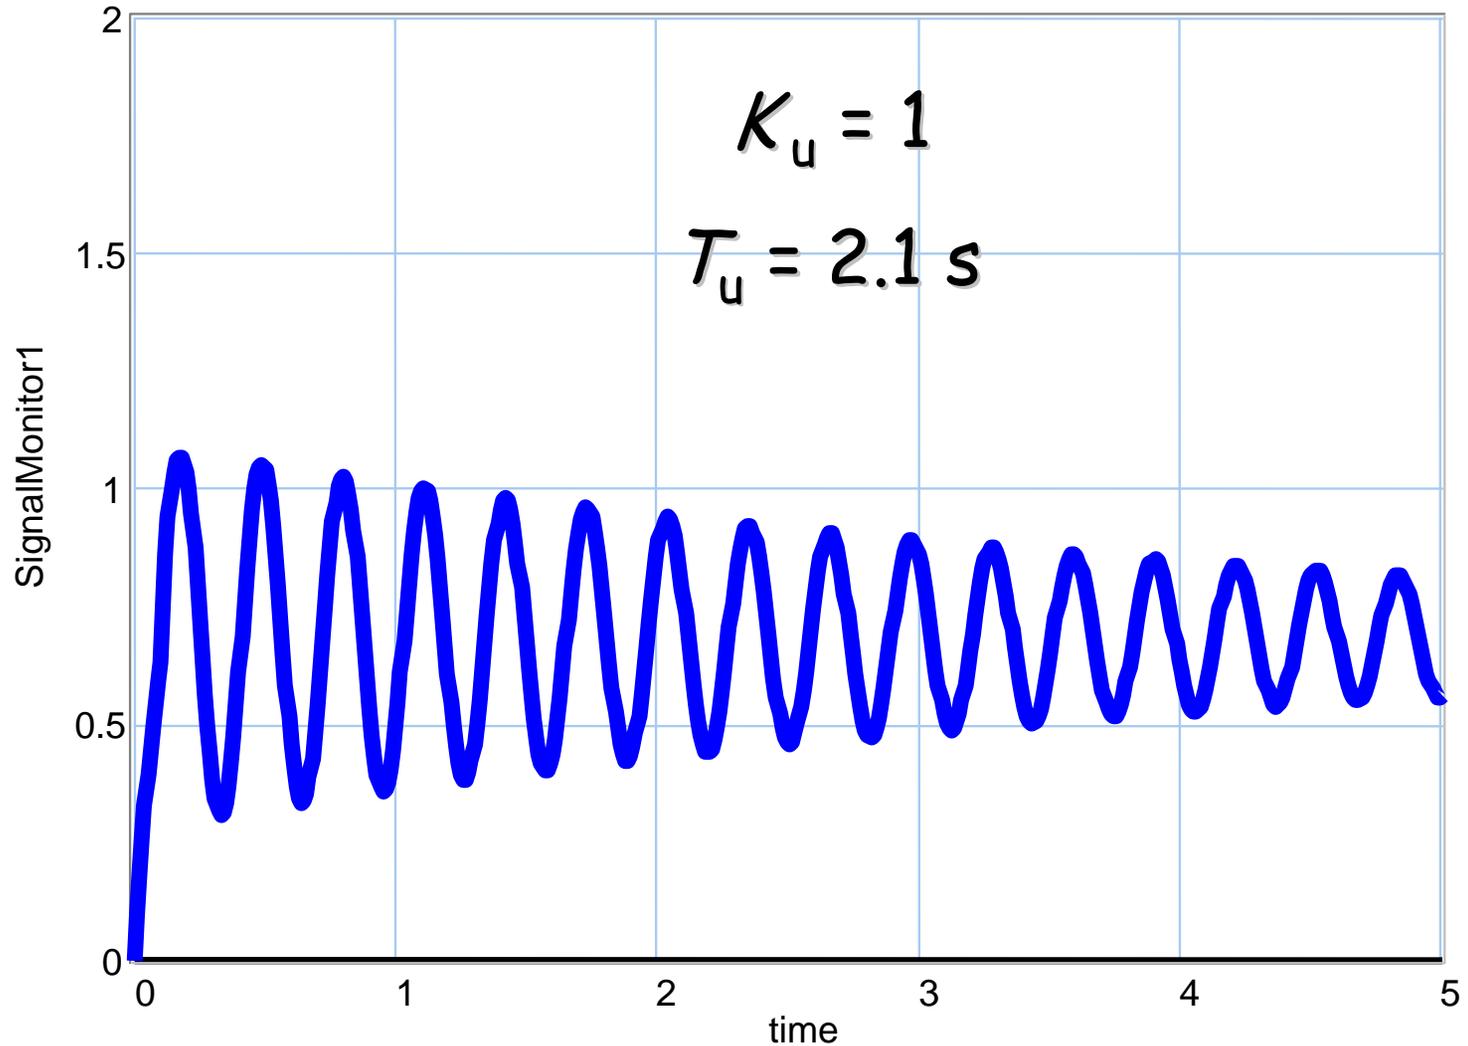

assumed to be unknown

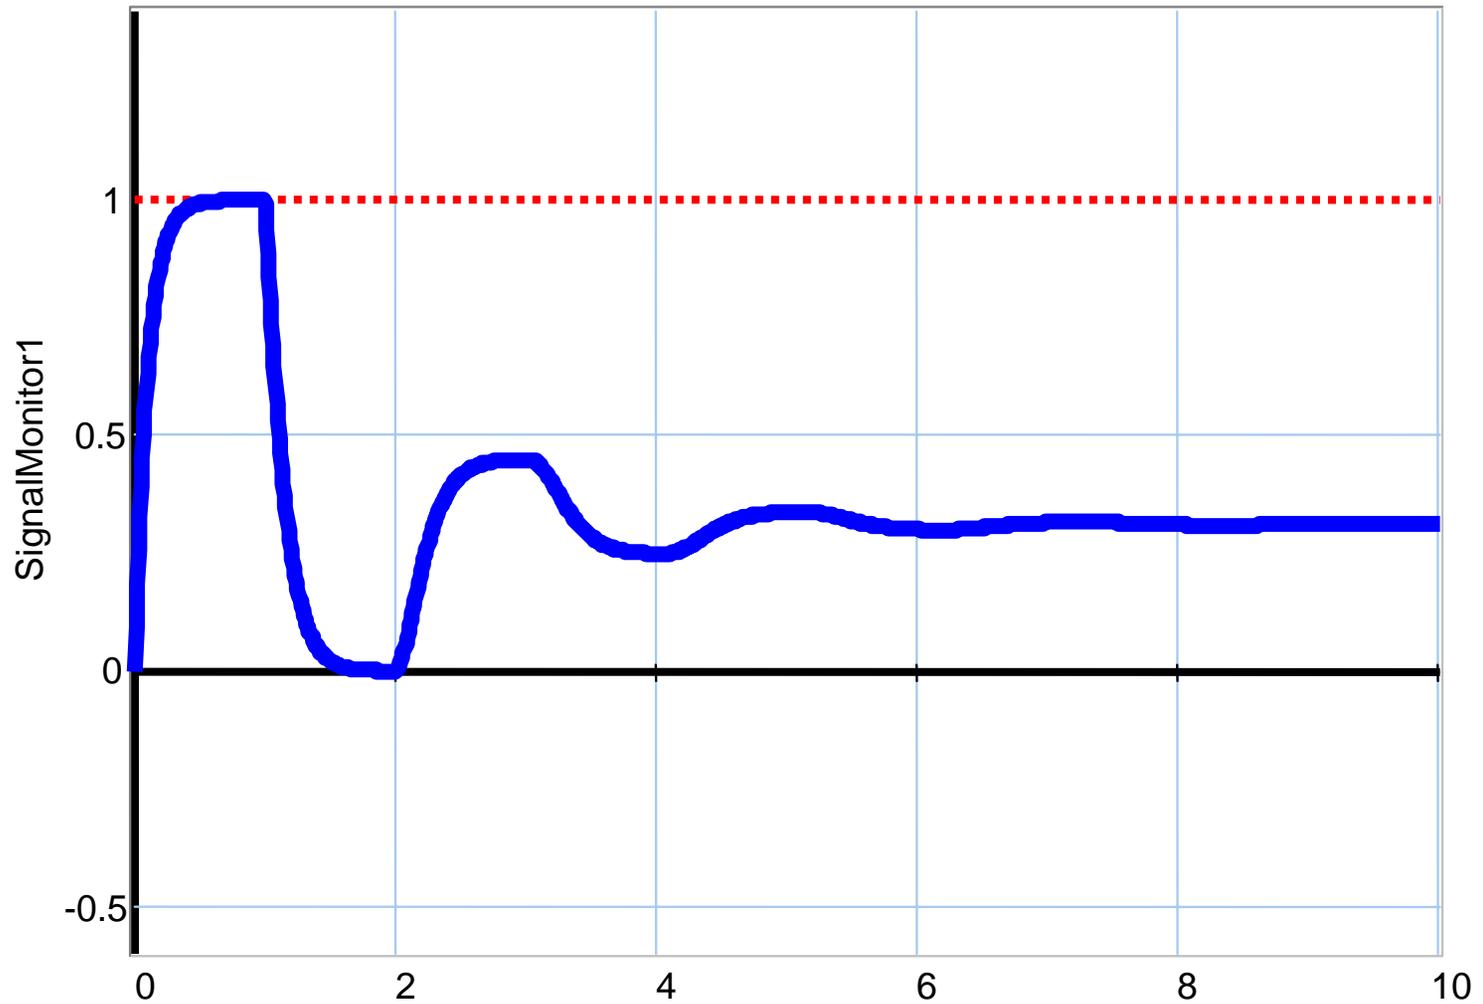

20-sim: PID_tuning_P_Td

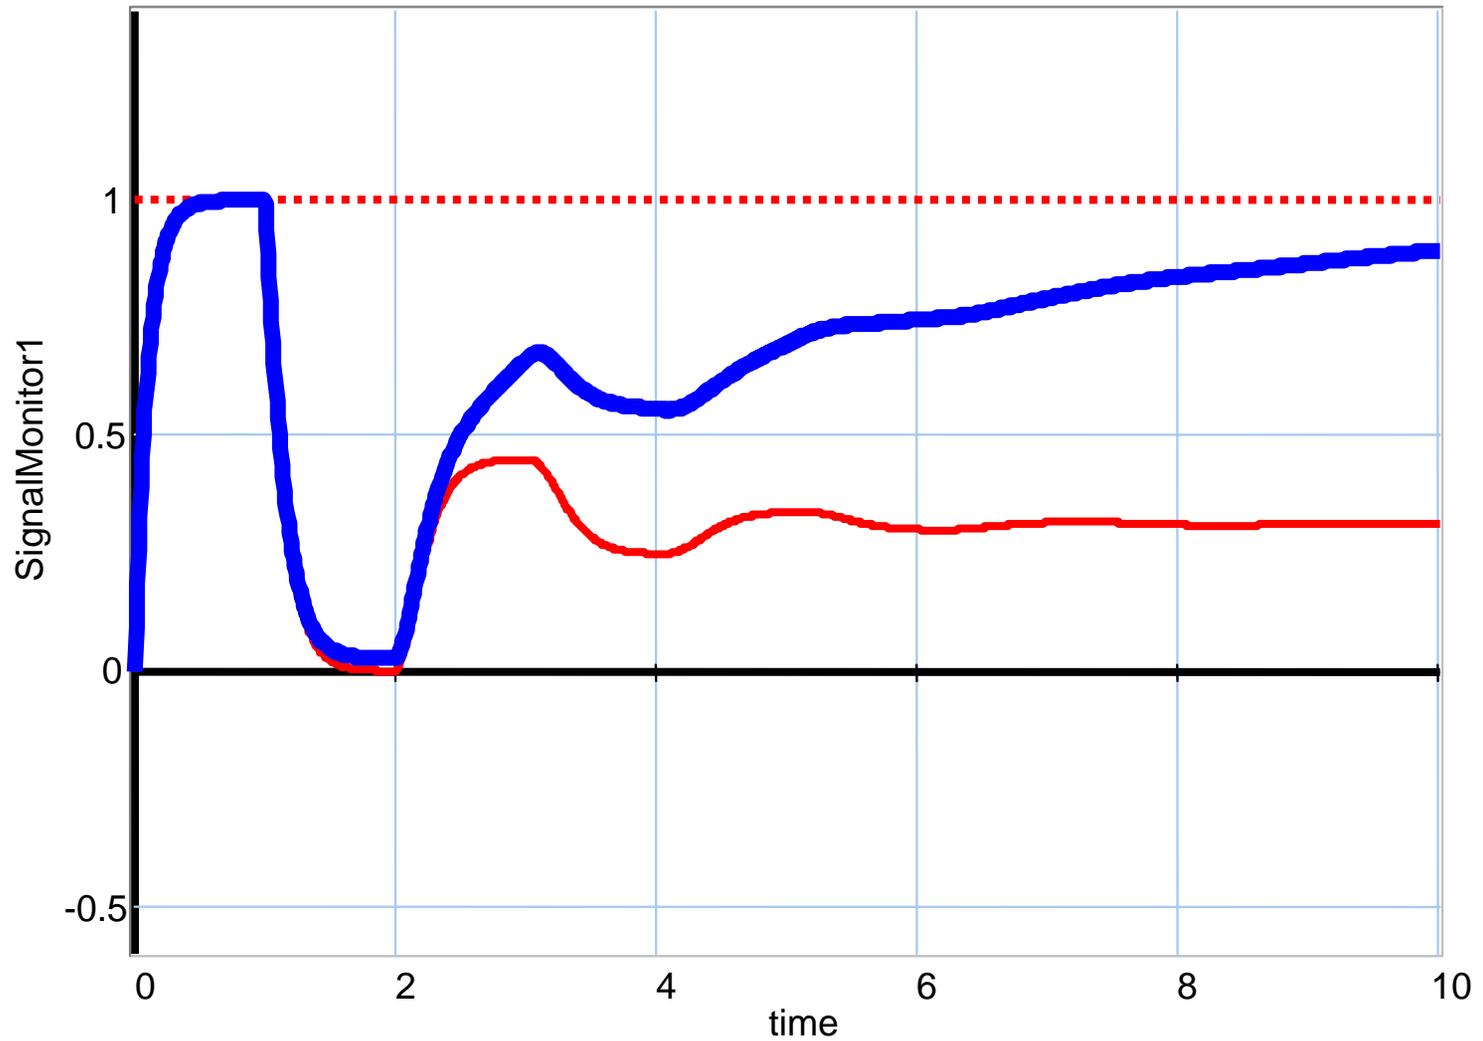

Bring feedback system
at the border of instability

Border of instability

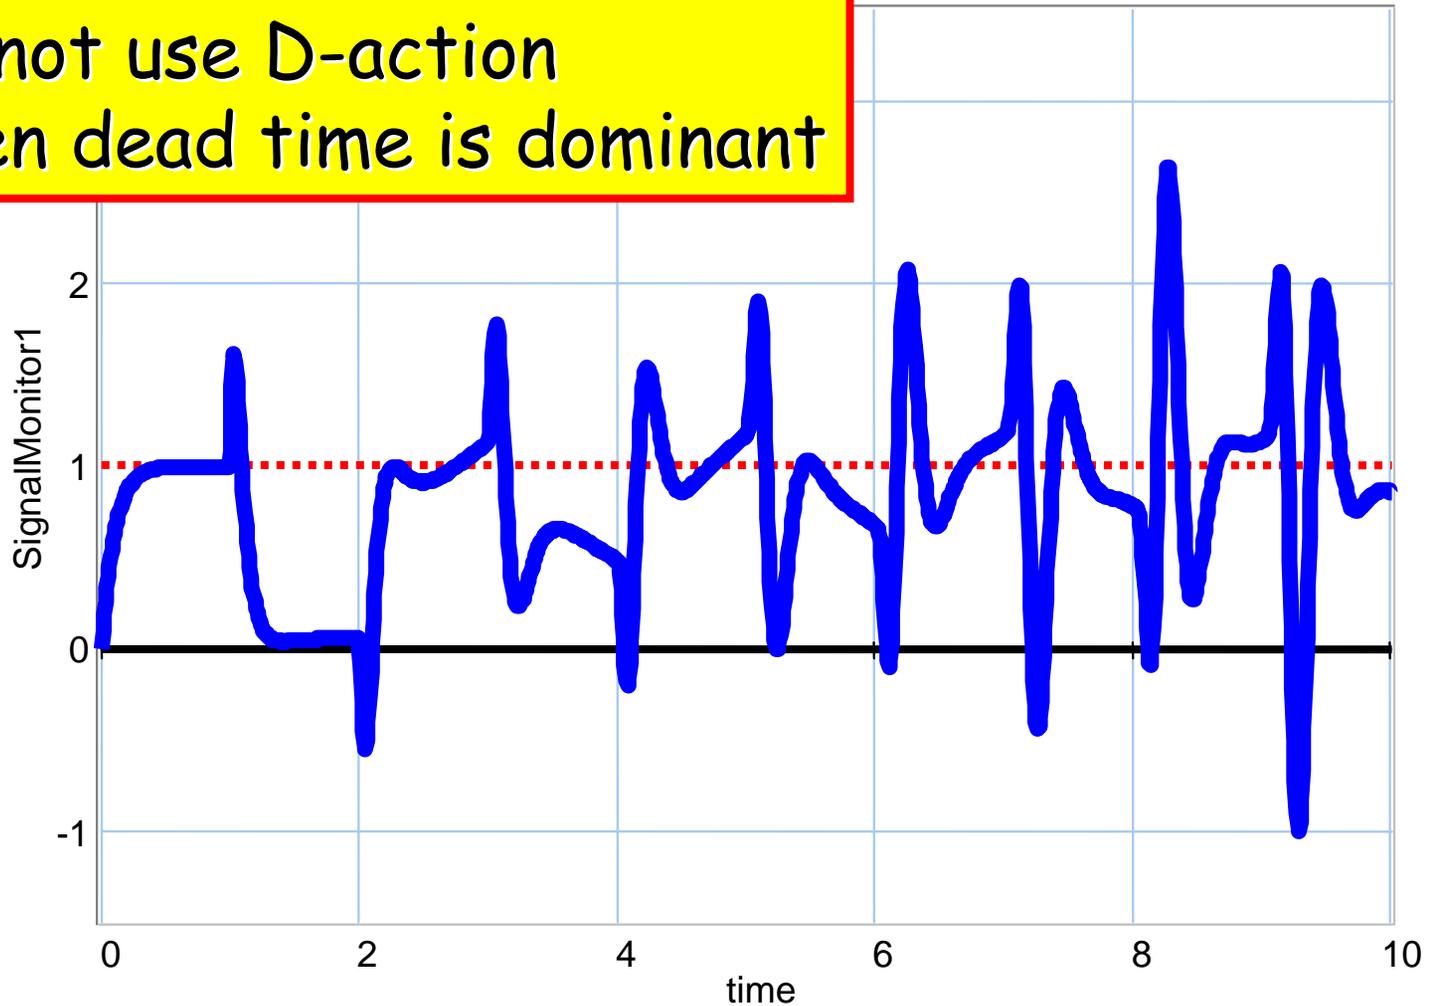

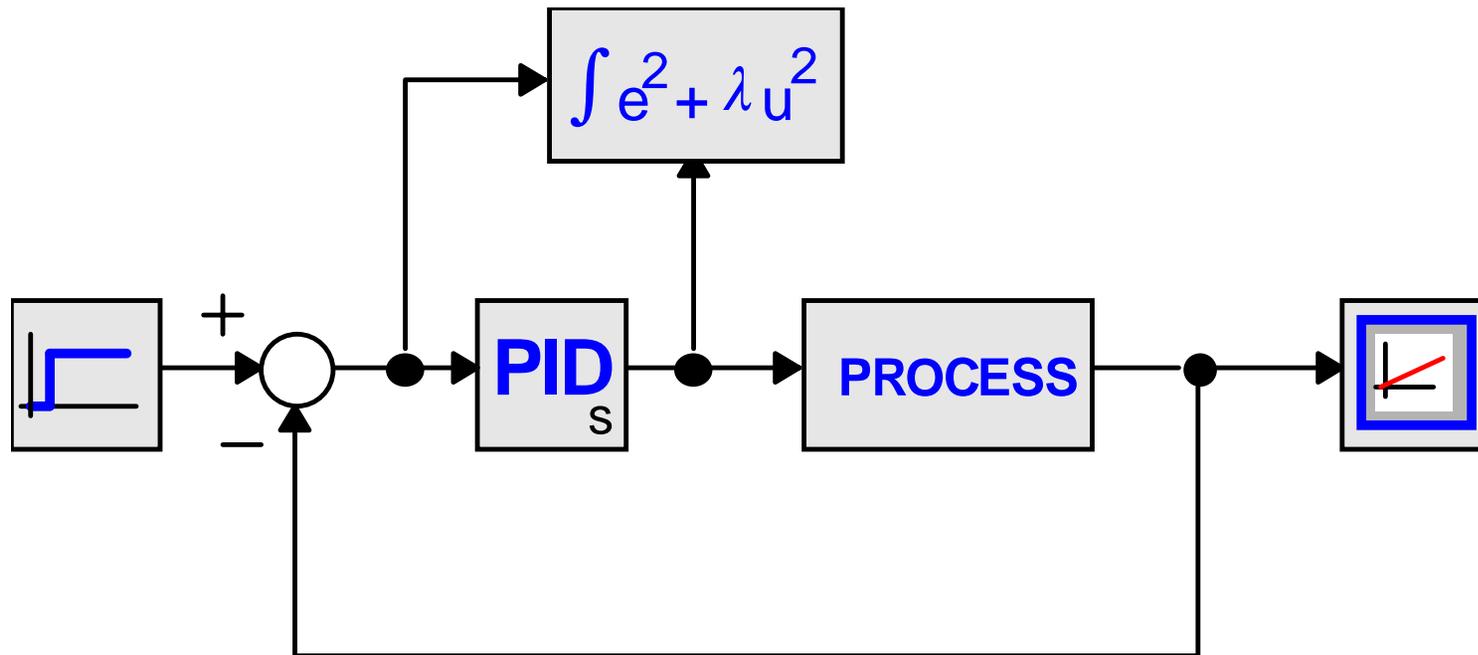

P-control

Do not use D-action
when dead time is dominant

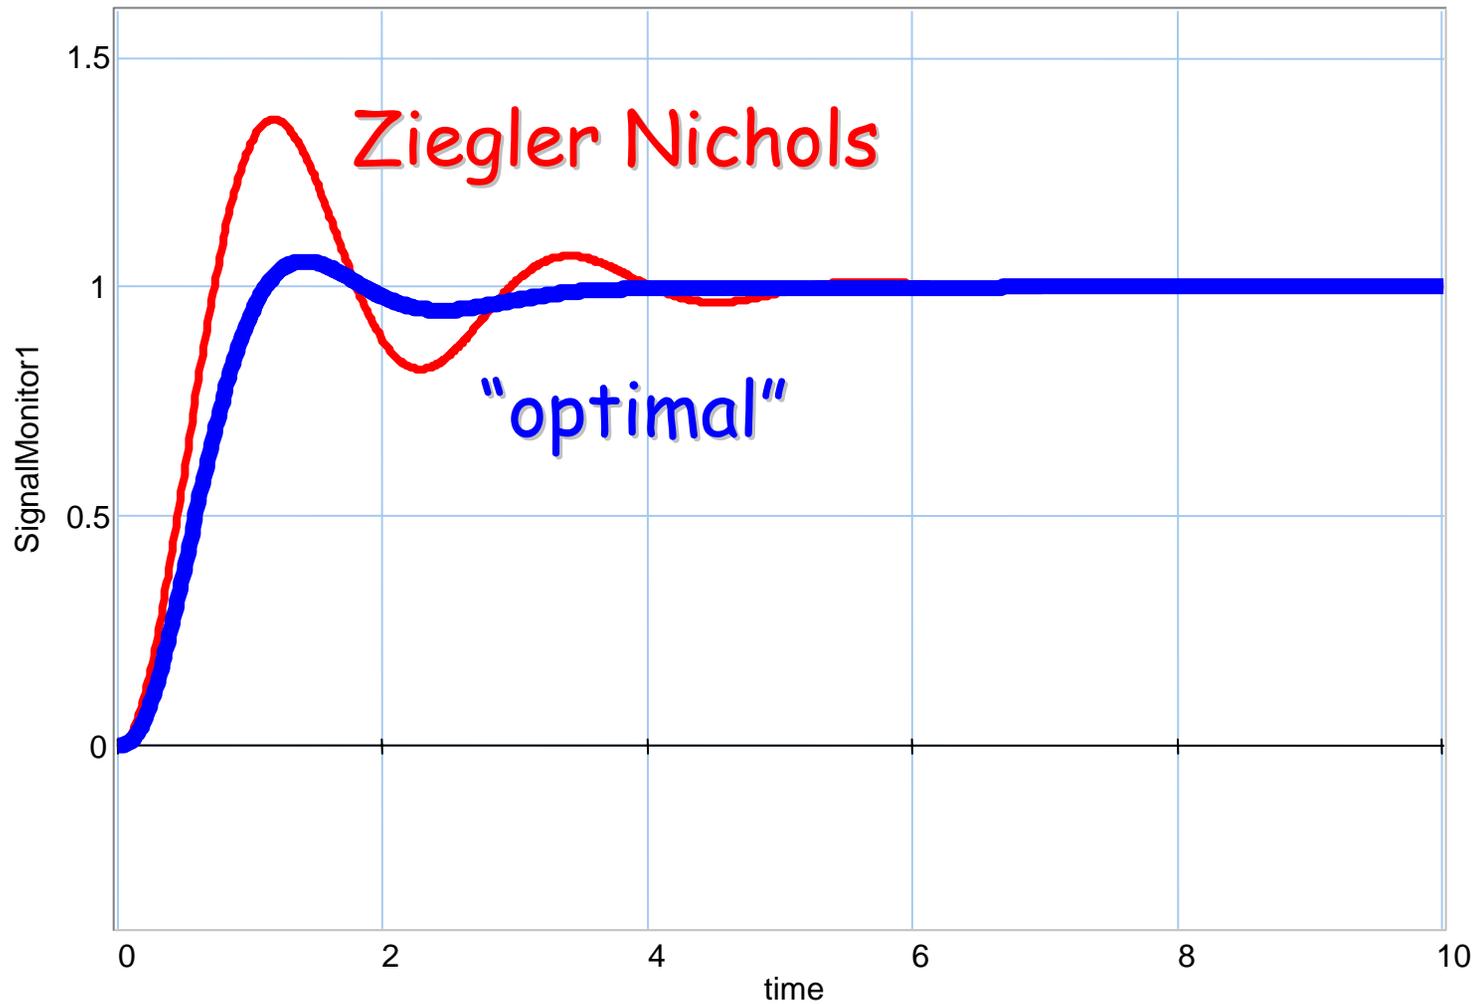

process must be known,
identified first,
or optimised on line

20-sim

Optimal tuning

- PID-control suited for:
 - systems with an S-shaped response
 - systems with time delay
- Ziegler Nichols rules give 'reasonable' responses
 - (more suited for disturbance rejection than for tracking)
- Better tuning possible
